Supervisor-Subordinate Friendships
The Effects of Promotion on Peer Relationships

Abstract

Research shows that friendships at work are important because of job satisfaction, organizational commitment, and job performance (Sias, 2005). While friendships can and do start between people at different levels of authority (Broid and Taylor, 1998), their relationships are often strained when the power difference becomes salient (Sias, 2004). This study focuses on the different communication tactics used to negotiate the supervisor-subordinate friendship, specifically when the supervisor was once the subordinate's peer before a promotion occurred. Through a survey of respondents from various organizations, we examined how communication is used to negotiate the roles of the supervisor-subordinate friendship.

RQ1: Can a peer friendship survive after a member of the dyad is promoted and becomes the supervisor of his/her friend?

Result:
A paired samples t-test showed a significant difference between both interpersonal solidarity and role negotiation.

Role: $t = 3.03, p < .05$
Role Negotiation: $t = 2.66(75), p < .05$

RQ2: Is there a difference in interpersonal solidarity and role negotiation between those who were promoted and those whose friend was promoted?

Result:
There were no differences.

RQ3: Is there a relationship between perceived importance of workplace friendships and interpersonal solidarity and role negotiation, and with perception of the relationship as better or worse after the promotion?

Result:
A Pearson Correlation showed perceived importance and interpersonal solidarity and role negotiation are related before a promotion, but not after.

Solidarity Before: $r = .27, p < .05$
Role Before: $r = .31, p < .05$
The longer individuals were friends before the promotion, the more likely they perceived their friendship as being better after the promotion.

$r = .23, p < .05$

RQ4: Is friendship longevity associated with role negotiation and solidarity?

Result:
The relationship between longevity and role negotiation before and after and solidarity before and after is significantly related.

Role Before: $r = -.26, p < .05$
Role After: $r = -.24, p < .05$
Solidarity Before: $r = -.53, p < .001$
Solidarity After: $r = -.36, p < .01$

RQ5: Is perception of the relationship as better or worse after a promotion related to role negotiation and interpersonal solidarity?

Result:
Perception of the relationship is related to role negotiation after a promotion.

$r = -.23, p < .05$

RQ6: Is there a difference between those who are still friends and those who are not on interpersonal solidarity and role negotiation?

Result:
There was a significant difference on solidarity between those who are still friends and those who are not after promotion.

An independent samples t-test showed:

$t = 3.86, p < .005$
Still Friends: $M = 5.17, SD = 1.07$
No Longer Friends: $M = 3.67, SD = 1.56$

Discussion

Conclusion
A workplace friendship can survive if one member of the dyad is promoted and becomes the supervisor of their friend. However, while the friendships survived many of the relationships changed either positively or negatively. Notably, interpersonal solidarity is significantly affected by a promotion. The results indicate that variables such as the length of the friendship prior to the promotion was positively related to the friendship surviving.

Implications
Previous research has focused on friendship deterioration after a promotion occurs; however, results of this study indicated that most friendships survive. Maintaining a friendship after a promotion is an indication of successful role negotiation.

Suggestions for Future Research

What influence does the culture of an organization have on whether or not friends are able to successfully negotiate their friendship post-promotion?
