Discussion
Our results reveal that Leet speak can produce the effects demonstrated in the Stroop Task. Interestingly these results were eliminated when we statistically controlled for ACT as a covariation. Given the effect of this subject variable and the possibility of diverse parametric effects, we believe a number of methodological improvements will strengthen the results of our study. These include using consistent list formatting and fonts, maintaining a consistent conditional format (BRL, CIC, IIC, RRL), increasing time limits, and improving instructions. Overall, we are confident that we can test new hypotheses about the Stroop Task using new stimuli such as Leet speak.
