Parental Attitudes towards Children with Perinatal HIV/AIDS

Olivia Schuenke, Advisor: Dr. Susan Wolfgram, Ph.D.
University of Wisconsin-Stout

Research Question:
What are the attitudes of parents who have a young child in a childcare setting who may encounter a peer with perinatal HIV/AIDS? *Parent is used interchangeably with "primary caregiver" in this study.

Theoretical Framework:
Family Ecology Theory (Paquette & Ryan, 2001)
This theory examines children's development through his or her experiences and environments. This theory is composed of four layers that describe each environment and how it impacts the child's development.
As applied to our study:
Using the Family Ecology Theory would help predict that parents with access to resources such as educational materials, community centers, and interpersonal relationships with people who have HIV/AIDS are more likely to have positive attitudes toward the virus.

Literature Review:
Bhana, D. (2010) examined what young children know about HIV/AIDS. Many of the children not only thought that blood but dirt and disease were transmitters of the virus.
Barbosa, S., Pinheiro da Costa, R., & Cunha Vieira, N., (2008) examined the stages parents or guardians have reached in discussing sex, sexuality, and/or HIV/AIDS prevention with their adolescent children. It was also illustrated that education level was an important factor for the stages of communication.
Macek, M. and Matkovic, V. (2005) examined the attitudes of teachers, students, and parents towards having HIV-positive students in the classroom. Among teachers and parents, there was a correlation between educational level and attitudes.

Hypothesis: Based on the literature, we hypothesized that parents would have positive attitudes towards their children's peers with HIV/AIDS. One reason for this may be the higher education levels given our target sample was taken from a university childcare center where the majority of parents were faculty or staff of the university.

Research Problem:
-In society, there are negative attitudes towards people with HIV/AIDS because many people lack education about the ways this disease can be transferred.
- In 2010, an estimated 3.4 million children under 15 were living with HIV, while 390,000 were newly infected mainly through mother to child transmission of HIV. (Provide pediatric treatment, 2010)

Methods:
Participants: 1 male and 15 female parents who have a child in a childcare setting.
Research Design: Non-random pilot study, Cross sectional, Purposive sampling method.
Procedure: Administered surveys to parents who had a child in a childcare setting.
Data Analysis Plan:
-Statistical Package for the Social Sciences (SPSS).
- Frequencies, mean-comparisons, and a reliability analysis: Cronbach's Alpha

Results: Based on the literature, we hypothesized that parents would have positive attitudes towards their children's peers with HIV/AIDS. Results showed that parents had a positive attitude towards children with perinatal HIV/AIDS. Our findings did support our hypothesis: 68.8% of participants in our study strongly agreed that children who are perinatal HIV/AIDS positive should be able to attend any and all schools; 75% of participants disagreed or strongly disagreed that students with perinatal HIV/AIDS should be taught in a different classroom than students who do not have perinatal HIV/AIDS, and 75.1% of participants either strongly agreed or agreed that they felt comfortable with children who had perinatal HIV/AIDS. Our reliability analysis was 0.781.

Conclusion: "My father was diagnosed with HIV when I was young. He raised five healthy children, but because of the lack of education in our small town, we were all relentlessly teased. Children were afraid of us. I think even our teachers were unsure how to handle us. While I think education is incredibly important for children to learn about how HIV/AIDS is transmitted, I also cannot stress enough the need for those children and their family members who have HIV/AIDS to not be singled out or discriminated against. Kids really are so smart. A little education on the topic could really go a long way." - Respondent

Survey Variables:
• Knowledge of persons with HIV/AIDS (KNO)
• Gender (GEN)
• Age (AGE)
• Education Level (EDU)
• Positive attitudes towards children with perinatal HIV/AIDS (PLA)
• Students should be informed of any student with an HIV/AIDS positive status (STU)
• Parents should be informed of any student with an HIV/AIDS positive status (INF)
• Parents should be worried if their child is interacting with another student who has perinatal HIV/AIDS (POS)
• If my child has a perinatal HIV/AIDS positive peer, I would want their teacher to educate my child about the virus (WOR)

Likert Scale Variables:
• Strongly Agree (SA)
• Agree (AG)
• Neither Agree/Neither Disagree (NA/ND)
• Strongly Disagree (SD)
• Disagree (DI)

Statistical Analysis: Frequencies, mean-comparisons, and a reliability analysis: Cronbach's Alpha
