Foreword

Working on this project that included innovative methods, was a great pleasure for me. I learned more about a field that always interested me. I therefore want to thank everybody who made this possible.

But first a few words about who I am. I came to the University of Wisconsin - Madison in August 1994 being part of an exchange program sponsored by the DAAD, the German Academic Exchange Service. Before I studied Chemical Engineering at the University of Stuttgart in Germany. Very early on in my studies I got introduced to the exchange program with Madison. After many meetings with Professor Zeitz, the managing Professor of the exchange program the first day in Madison finally arrived.

The time in Madison was a very special time for me. I met many different and interesting people. I could study different subjects that interested me for a very long time already. The project I could work on was definitely the climax of my academic life. A project that included investigations in a new field, a project that allowed to do big steps towards a goal but as well a project that taught me that not every step I made was rewarded with success. I am very thankful for each one of the experiences I could make here in the course of this project and in the entire time here in Madison.

A very special thank belongs to Professor Klein, Professor Beckman and Professor Mitchell, who had the idea and the vision to investigate in this field. They made it possible for

me to stay in Madison after the exchange program was over. Professor Klein, Professor Beckman and Professor Mitchell were very helpful by questioning the different approaches made and by challenging me in my work. Their vision brought the work forward.

Professor Zeitz with his experience of running this exchange program for many years was of incredible help before I even left Stuttgart. His insight into what to expect in Madison helped prepare for the time in Madison. Without his help the time before the departure with all the paperwork and beurocratic necessities would have been very difficult. I wish for Professor Zeitz that the future of this exchange program is secure. It is an experience that I do not want to miss and that I hope many more students will be able to have. The work and energy Professor Zeitz puts into this exchange program is remarkable.

The path that many other students sponsored by the DAAD walked on was very easy to follow. The preparation of the DAAD was impressive. It was no problem to get a visa. The DAAD took care of insurance problems and all these little things that are so easy to forget but that are so important for a successful time were taken care of. The work the DAAD does is incredible. Very special thanks belong to the DAAD for the commitment to bring students abroad to experience a different way of studying and a different way of life. The DAAD's commitment to interest students not only in their own field but as well in what is happening around them and to interest them in other cultures. In the light of civil wars over cultural differences, it is more than important that the understanding that despite the cultural differences we are all one people. And that the differences enrich the life and not oppress one's personal

culture. The DAAD provides ground to build on for more acceptance in this world. I hope that it is possible for many more students to go this way.

The friends I found here, in the Graduate Fellowship of Intervarsity Christian Fellowship, the University Community Church and all my other friends I met in the time here in Madison were there when I needed them and I could be there when they needed me. A very special thank belongs to my roommate Andy, whom I lived with for more than a year. Those discussions at two o'clock in the morning about the differences between the US and Germany challenged my insight in each one of the cultures. It helped me not only to understand more about the US but even more to help me understand Germany. Suzy who became a very special friend to me in the past year kept me going at those times when things did not look that good. Suzy tried to explain to me the all so American things. She tried to explain to me why the top ten list of David Letterman is funny, well now I know why, but I still cannot laugh about it. I guess these are things that take longer than sixteen months to learn.

May be the thank to my parents should have been at the first place. My parents are those two people who probably know me the longest and probably the best too. When I got home from school as a little boy and even now with a new idea how I could change the world, they listened. But they taught me that all change has to start out in my own life first and that little things can create a big change too. My parents raised me in such a way that I could accept the differences of different people. They taught me patience as well as that it is sometimes necessary to work hard in order to achieve a goal. My parents taught me that only

a few things are free in this world, for all the other things you have to work. My parents taught me that seven million two hundred years are not enough to understand 'live the universe and everything', they taught me much rather that every little step we make to understand more about the field we work in and every step to understand who we are is worth it. Every little thing in our lives is worth to be thankful for.

The next step after returning to Germany is right ahead, and I am ready to work on it. The preparation I received here, from advisers, friends and from live will help to peruse happiness in what ever is to come.

Thank you everybody for your help!

Matthias M. Bauer
